

Test Chap2

Inès_Mahjoubi_ 3A33

1. what is the init process?

→ Init is the parent process, run by the kernel. Its main role is to create the process from the script stored under /etc/inittab

2. what's a runlevel and how many that we can find?

→ Runlevel is the system software configuration that allows existence only at a selected group of processes and we can find 8 runlevels

3. what we can find in /etc/init.d/ ? and give me an example of a custom script that we can add there.

→ in the /etc/init.d directory we can find the start, stop and restart commands

4. what we can find in /etc/rc.d/ ? and give me an example of a custom script that we can add there.

→ we find the scripts that control the services, run at startup at different runlevels from 0 to 6

5. what's the difference between init and telinit

→ telinit is a tool that informs init and forces it when to change the runlevel

6. what is the LSB?

→ Linux Standard Base is a common environment for packages. His goal is to facilitate the creation of binary packages

7. what's the difference between runlevels and system

→ system can activate multiple targets simultaneously while only one runlevel can be "active" at any given time
